To whom it may concern,

We have ordered PlanetDISK® RBC systems for our World Bank funded project of BTC – Baku-Tiflis-Ceyhan pipeline. The PlanetDISK® waste water treatment system has been in use at 2 of our stations for the last 14 months and at another station for over 2 yrs.

We have observed that with exception of some stut rods of 12 mm. diameter failing at 2 stations, the system has been working without any failure at all.

Stut rods being the only problem, we have also observed that CTG PlanetTEK always gave prompt and professional technical service beyond our expectation.

Although the targeted effluent criteria for BOD \leq 25 mg/L , the actual effluent has been around 5-15 mg/L.

RBC is preferred by our client BP for its easy maintenance, reliable and consistent process results. RBC is also known for its less energy usage. PlanetDISK® is a successful example of RBC technology.

BTC pump stations located at 3000 m altitude has very harsh climate conditions and yet PlanetDISK® system has been working and yielding consistently good result.

Should we need any other compact waste water treatment units, we would prefer RBC technology and PlanetDISK®.

We thank CTG PlanetTEK for an excellent system and technical service.

Berker Evren
